Building Reports, Dashboards, and Custom Pages Using UI Builder

1. Aim

To build reports, dashboards, and custom pages using the UI Builder in Zoho Creator for the Rainwater Harvesting Record System to organize, analyze, and visualize rainfall data, storage tank details, and water usage information.

2. Procedure

Step 1: Open the application

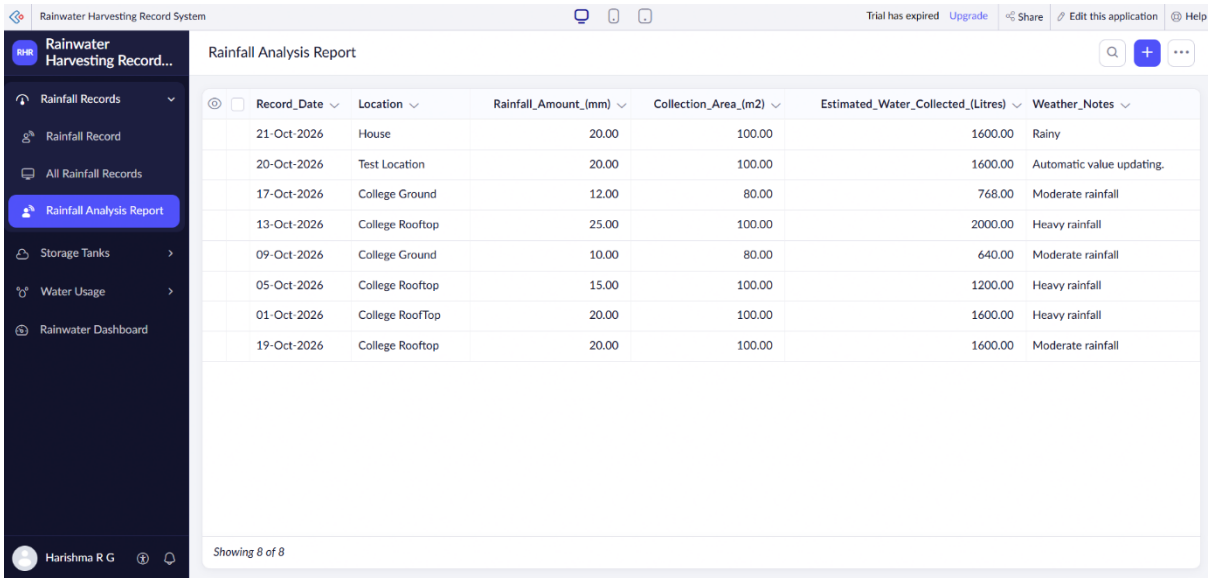

1. Log in to your Zoho Creator account.
2. Open the Rainwater Harvesting Record System application.
3. Ensure that the Rainfall Record, Storage Tank, and Water Usage forms contain sample records.

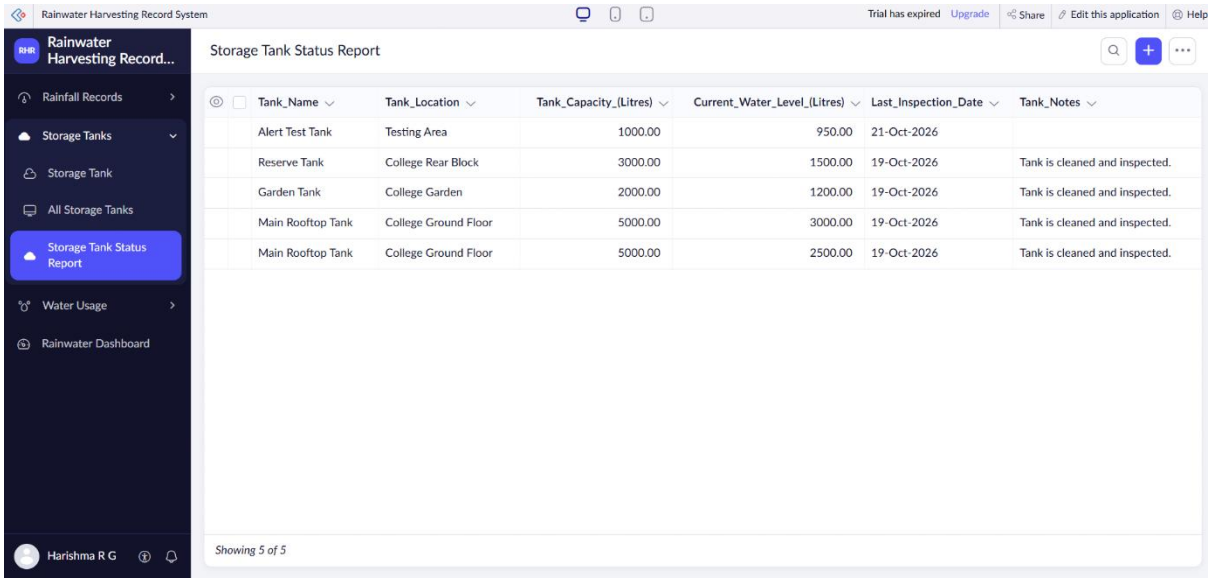

Step 2: Build reports

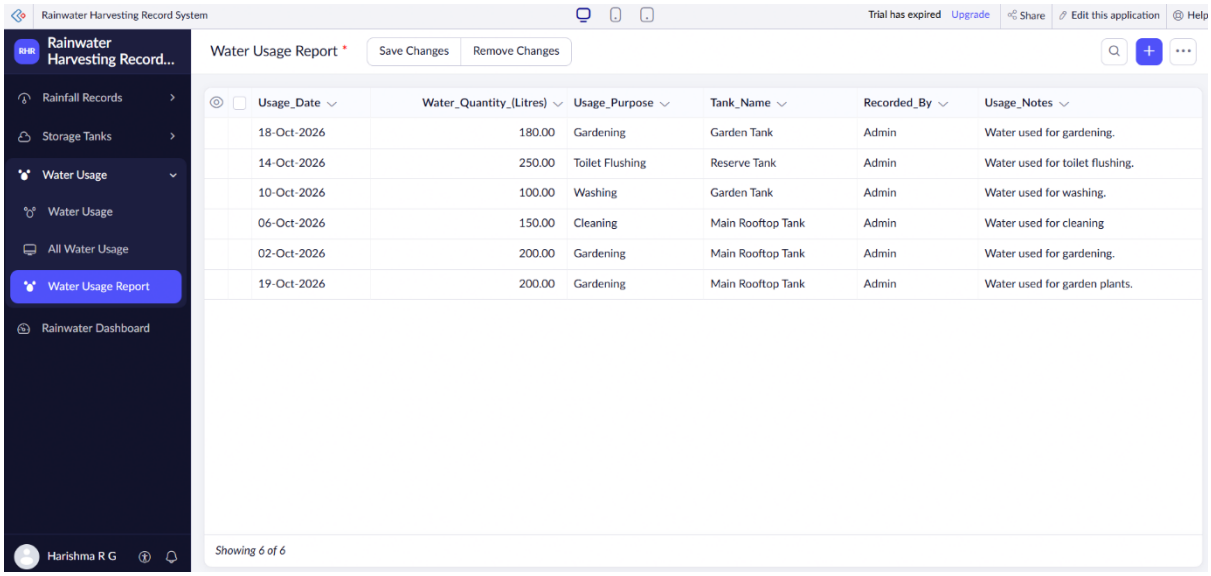

1. Navigate to the Reports section in the application builder.
2. Create a report using the Rainfall Record form and name it Rainfall_Analysis_Report.
3. Select relevant fields such as Record Date, Location, Rainfall Amount, Collection Area, and Estimated Water Collected.
4. Create another report named Storage_Tank_Status_Report to display tank names, capacities, and current water levels.

5. Create a third report named Water_Usage_Report to display usage dates, quantities, purposes, and associated tank names.
6. Save the reports and verify that they display the stored records correctly.

OUTPUT

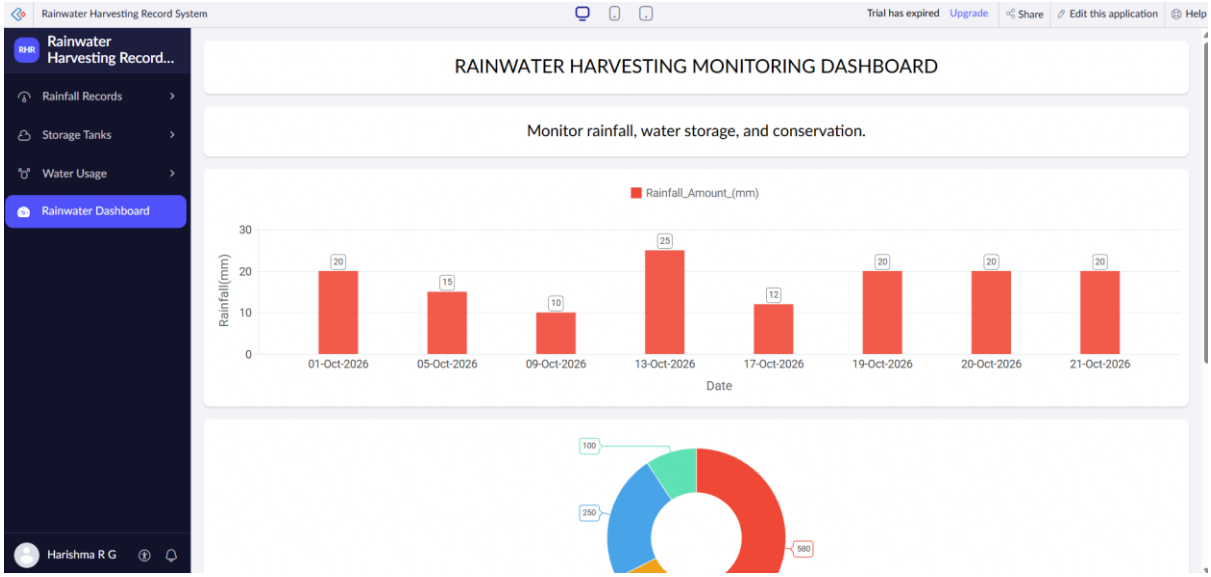

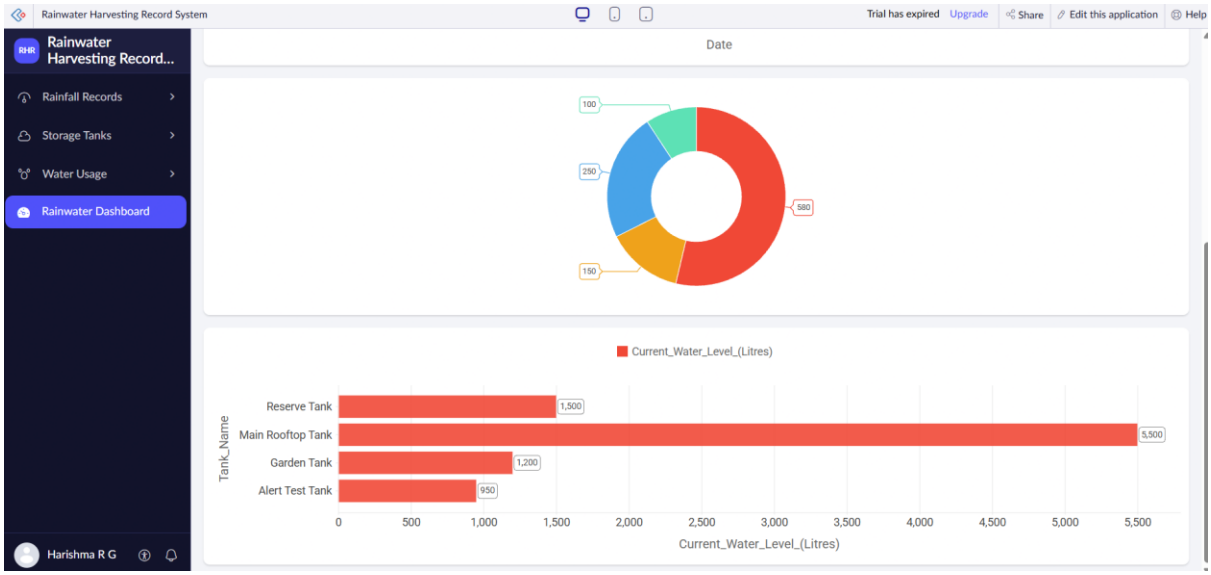

Step 3: Build dashboards

1. Navigate to the dashboard or page-building options available in your Zoho Creator application.
2. Create a dashboard page named Rainwater_Dashboard.
3. Add a chart to analyze rainfall measurements over time.
4. Add a chart to visualize water usage by purpose.
5. Add a chart to compare the current water levels of different storage tanks.
6. Configure the chart fields and titles, then save the dashboard.
7. Preview the dashboard and check whether the charts display the available data correctly.

OUTPUT

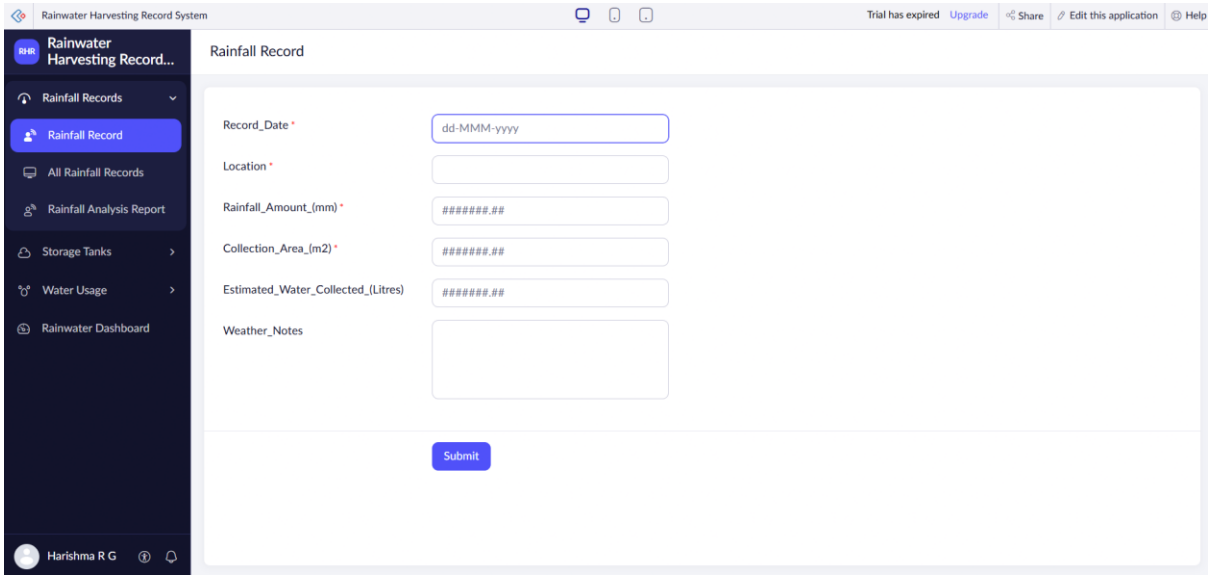

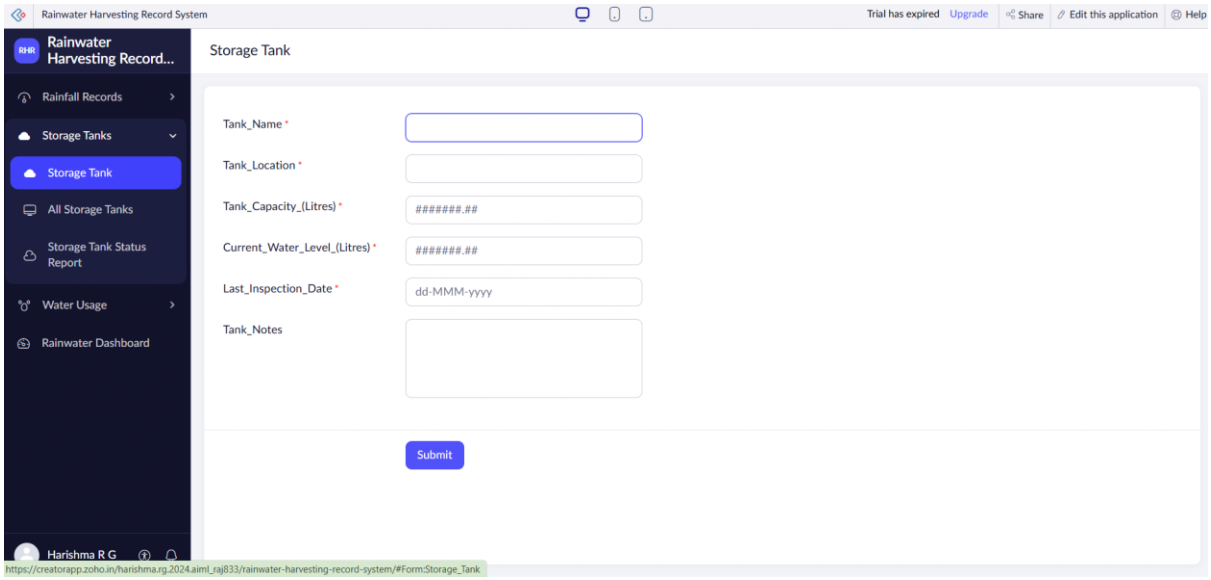

Step 4: Create a custom page using UI Builder

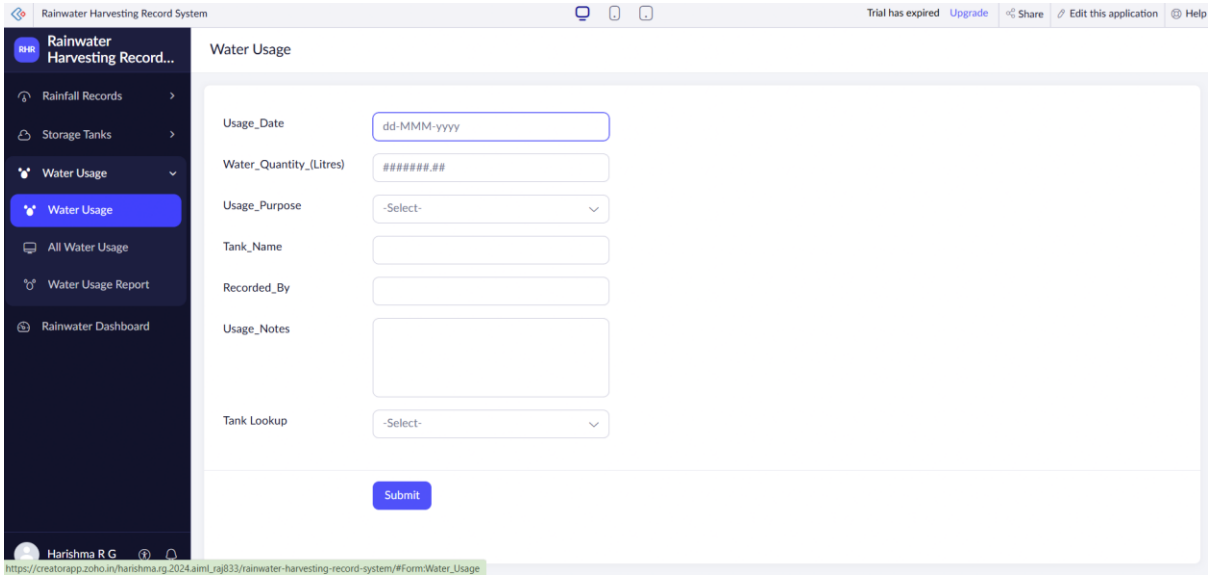

1. Open the Pages section and select the option to create a new page.
2. Name the page Rainwater_Overview_Page.

3. Use the visual builder to arrange headings, text, report components, charts, and other supported elements.
4. Add a heading such as Rainwater Harvesting Overview.
5. Organize the page into sections for rainfall analysis, tank status, and water usage.
6. Add the relevant reports and charts to the page where supported.
7. Adjust the layout and formatting to improve readability.
8. Save and preview the page to verify its appearance.

OUTPUT

Step 5: Test the application

1. Open each report and check the displayed records.
2. Verify that the rainfall and water usage charts show the expected data.
3. Check whether the storage tank chart displays the correct tank names and water levels.

4. Open the custom page and confirm that its components are arranged properly.
5. Make corrections if any report, chart, or page component does not display as expected.

3. Components Used

Component	Purpose
Rainfall Analysis Report	Displays rainfall measurements and estimated collected water
Storage Tank Status Report	Displays tank capacities and current water levels
Water Usage Report	Displays water consumption records
Rainfall Analysis Chart	Shows rainfall patterns
Water Usage Chart	Compares water consumption by purpose
Tank Water Level Chart	Compares water levels across storage tanks
Custom UI Page	Organizes reports and charts into one interface

4. Result

Reports, dashboards, and custom pages were developed for the Rainwater Harvesting Record System using the visual-building features of Zoho Creator. The reports organize rainfall records, storage tank details, and water usage information in a

structured format. The dashboard presents rainfall patterns, water consumption by purpose, and current tank water levels through charts.

The custom page provides a centralized interface for presenting the application's important information. These components improve data accessibility, simplify monitoring, and help users understand the performance of the rainwater harvesting system.

Thus, the experiment demonstrates how reports, dashboards, and custom pages can be used to transform stored application records into meaningful information for monitoring and decision-making.
