Workflow by Deluge Scripting in Zoho Creator

AIM

To create and configure workflows using Deluge scripting in Zoho Creator to automate rainfall water collection calculations and generate alerts when the water level in a storage tank reaches the specified threshold.

PROCEDURE

1. Open Zoho Creator and select the Rainwater Harvesting Record System application.
2. Navigate to the **Workflow** section in the application builder.
3. Create a workflow for the **Storage_Tank** form and configure it to execute after a record is submitted.
4. Write a Deluge script to check the current water level against the specified tank capacity threshold.
5. Configure the workflow to display or send an alert when the tank water level reaches the defined limit.
6. Create another Deluge action for the **Rainfall_Record** form to calculate the estimated amount of water collected automatically.
7. Use the formula:

Estimated Water Collected = Rainfall Amount × Collection Area × Collection Efficiency

8. Set the collection efficiency to 80% (0.8). For example, if the rainfall amount is 20 mm and the collection area is 100 m², the estimated water collected is:

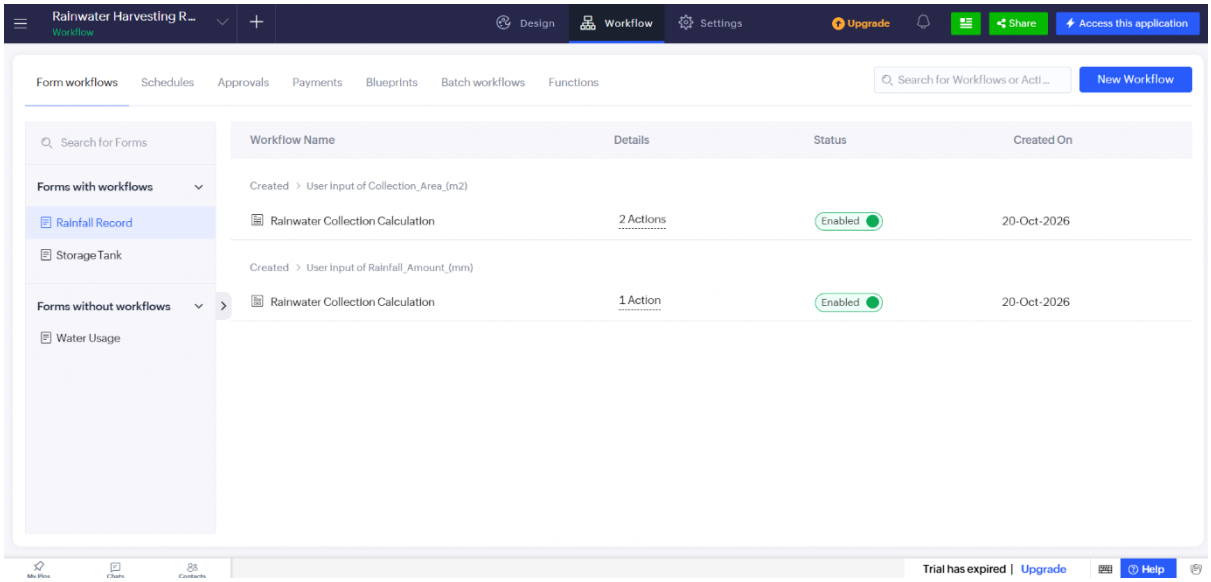

$$20 \times 100 \times 0.8 = \textbf{1600 litres}$$

9. Save and enable the workflows. Enter sample data into the forms to test the automation.

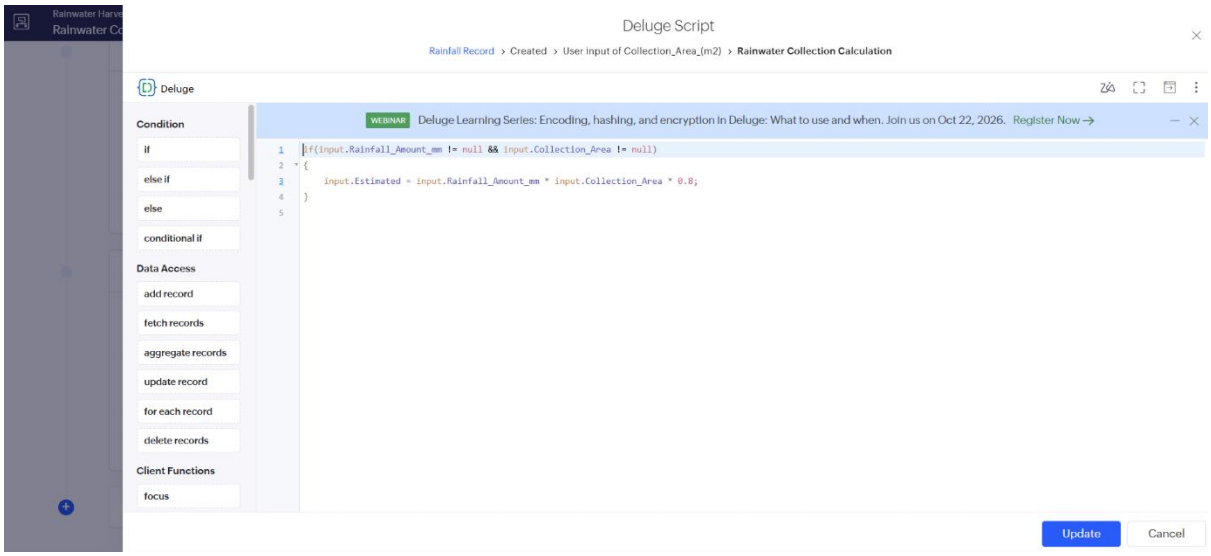

10. Verify that the rainfall calculation produces the expected value and that the tank alert is triggered when the configured condition is satisfied.

OUTPUT

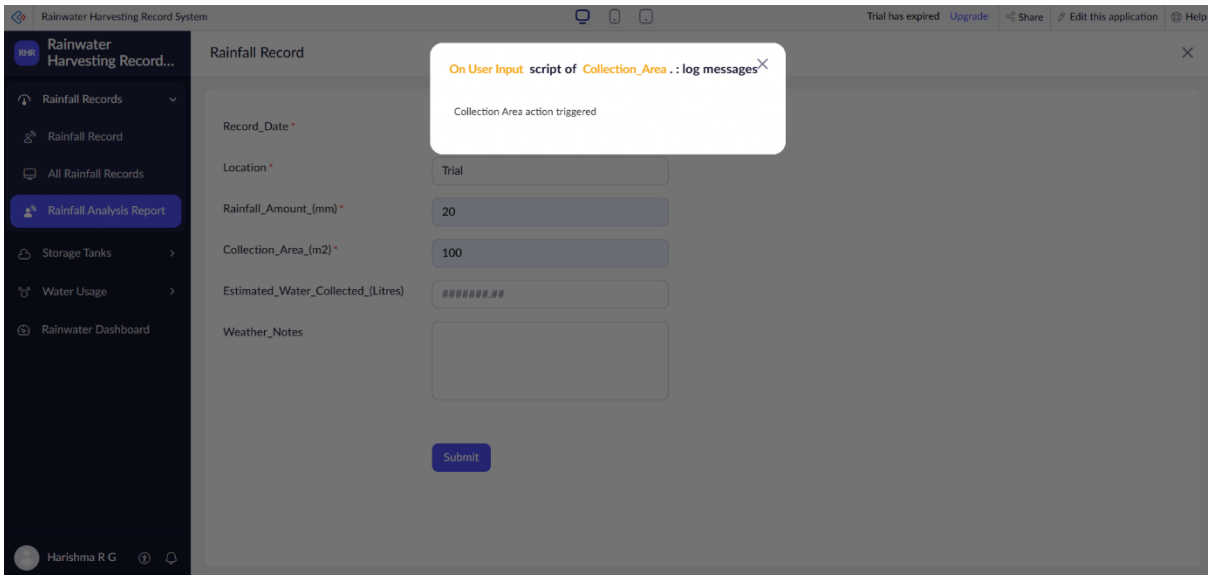

Workflow Configuration

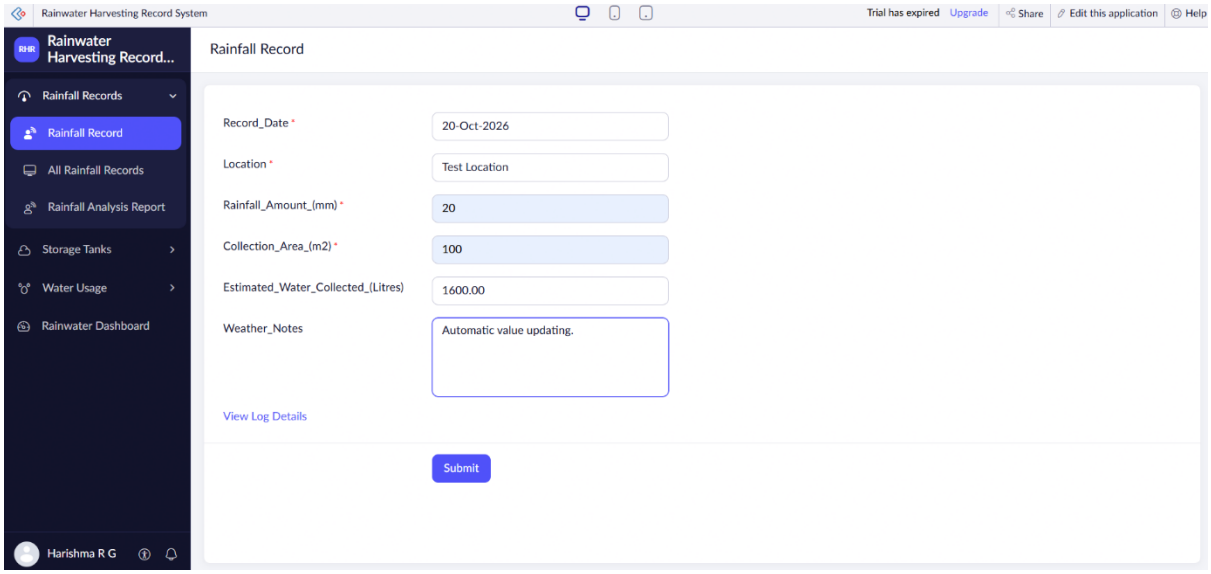

Deluge Script

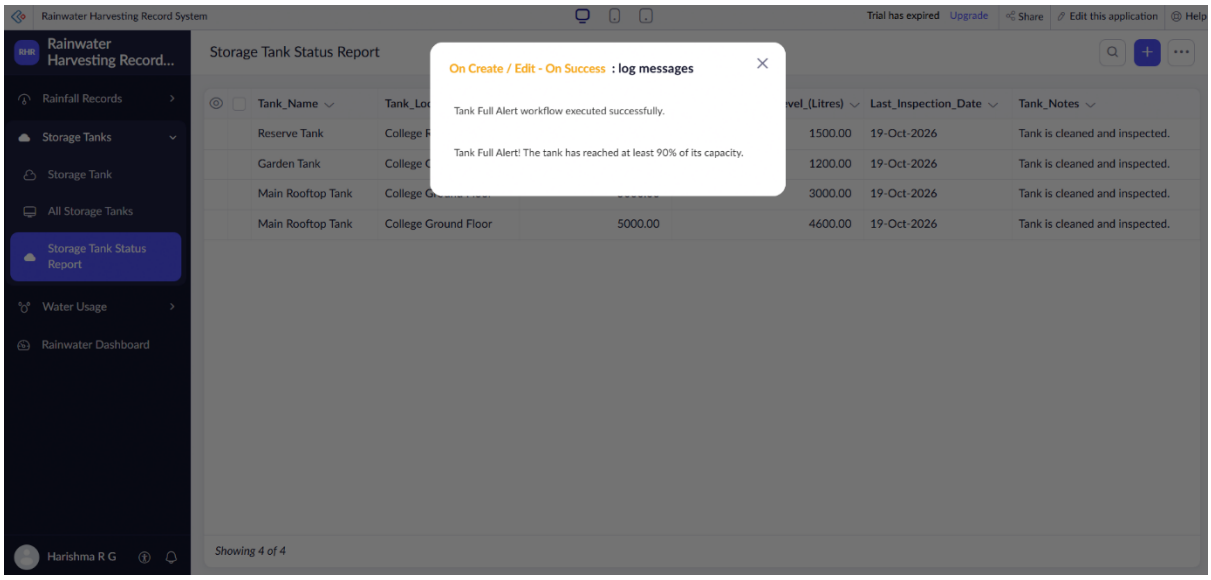

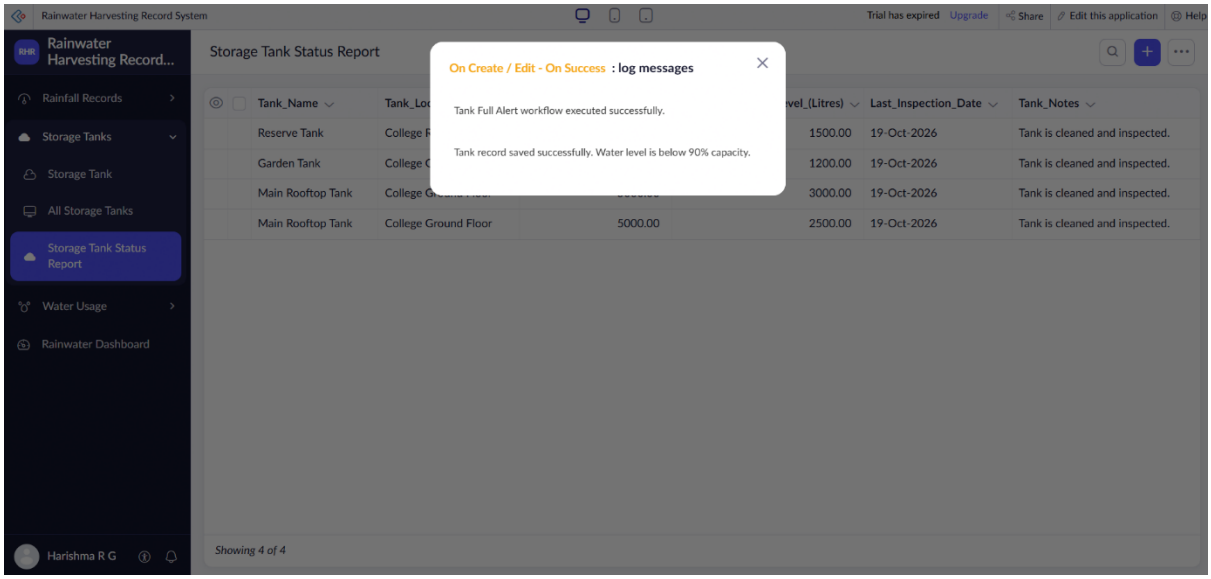

Rainfall Calculation

Tank Full Alert

RESULT

The workflows were successfully created and tested in Zoho Creator using Deluge scripting. The rainfall calculation automatically calculated the estimated water collected based on rainfall amount, collection area, and 80% collection efficiency. For a rainfall amount of 20 mm and a collection area of 100 m^2, the system calculated 1600 litres.

The Tank Full Alert workflow was also tested successfully. When the tank water level reached the configured threshold, the alert appeared and a success message was displayed. Thus, Deluge scripting was used to automate calculations and tank-level alerts in the Rainwater Harvesting Record System, reducing manual effort and improving record management.
